Jboss application server interview questions and answers for experienced.

P18. What hibernation object wraps the JDBC connection?Ans: The session interface adjusts a JDBC connection. However, there are many differences: JAX-WS is mapped to Java 5.0 and is based on many of the new features of Java 5.0 such as web service annotations. What is the cache of jBoss in short? Enabling the creation of business processes that coordinate between people, applications and services is the functionality of the BPM engine. Therefore, always check the application requirements before making a change from Autonomous mode to Domain mode. It is built on a stack of network communication protocols that provide transport, discovery, reliability and fault detection, and cluster membership management services. P13. It is retrieved by the openSession () method of SessionFactory. P1. JAXB promises mappings for all XML Schemas. What is the difference between JAXâWS and JAX-RPC?Ans: Java API for XML-Based RPC (JAX-RPC) is a Java legacy web services API, uses SOAP and HTTP to make RPC over the network and allows the creation of web services and web applications based on the specific SOAP 1.1, Java SE 1.4 or lower.JAX-WS 2.0 is the successor to JAX-RPC 1.1. JAX-WS still supports SOAP 1.1 over HTTP 1.1, so interoperability will not be affected. Ans: A fundamental difference between the Autonomous mode and the Domain mode is that the Autonomous mode allows the manual implementation of applications by copying files to the implementation folder. What do you need to set up a cluster with JBoss? You can choose to distribute data with JBoss Messaging to move it to where it’s needed for cycle or event-based programming. It runs under any JVM of 1.3 or later. Move an application from Autonomous mode to Domain mode: Are you guaranteed that you won’t run on any theme? P14. Seam also unifies It integrates popular open code technologies like Facelets, Hibernate, Itext and Lucene. It is based on JGroups and allows the grouping and high availability of this data. Combining the development of workflow applications with process design is a feature of JBoss jBPM. How do I monitor JBoss and detect an application’s bottleneck? The first step is to use Joss JMX agents and monitor the components deployed on the application server.After finding most of the time spent by certain components or libraries or most of the resources, you can use Jprobe, a specialized tool to examine the individual object or objects loaded into memory. This option assumes that the container has exclusive access to the persistent store and therefore does not need to synchronize the bean status in memory of the persistent store at the beginning of each transaction. What is JBOSS?Answer: JBoss is a popular open source application server based on JEE technology. JAX-WS introduces message-oriented functionality, an asynchronous dynamic functionality missing from JAX-RPC. Q11. Q6. A: Seam works very well on other application servers â just like everything else the Hibernate team does, this is not unique to JBoss. What do you know about Seam?Answer: Built on the JavaServer Faces and EJB 3.0 standards, JBoss Seam unifies components and programming models and provides a coherent and powerful framework for fast web application creation with Java EE 5.0. Seam simplifies web application development and enables new features that were previously difficult to deploy to users. hand, such as status conversations, multi-window operation and simultaneous handling of fine-grained AJAX requests. When configured in Domain mode, multiple servers are managed from a centralized point called the Domain Controller that hold the configuration ³ and provisions for deployment to individual nodes that are part of the Q4 domain.
